

# **IRI MODEL REPRESENTATION OF TOTAL ELECTRON CONTENT AT 0UTC AND 6UTC OVER GHANA**

Patrick Essien

University of Cape Coast

Ghana

# STUDY OBJECTIVE

---

To show how the iri model describes the relationship between the electron density and temperature at various heights for 0UTC and 6UTC over Ghana

# DATA SOURCE AND INPUT PARAMETERS

The data is from Model Web Browser Results  
*iri* model listing

year= 1997., month= 01, day= 10, hour=0,

- ✘ URSI maps are used for the F2 peak density (NmF2)
- ✘ CCIR maps are used for the F2 peak height (hmF2)
- ✘ B0-Table option is used for the bottom side thickness parameter B0

# DATA SOURCE AND INPUT PARAMETERS

- ✘ Danilov- option is used for the ion composition
- ✘ The foF2 STORM model is turned on
- ✘ IRI-95 option is used for the electron temperature
- ✘ IRI-95 option is used for the D-region Ne
- ✘ Scotto-97 no L option is used for the F1 occurrence probability

# DATA SOURCE AND INPUT PARAMETERS

- ✘ Peak Densities/cm-3: NmF2= 1000.0 NmF1= 0.0 NmE= 1713.9
- ✘ Peak Heights/km: hmF2= 100.00 hmF1= 0.00 hmE= 110.00
- ✘ Solar Zenith Angle/degree 154.6
- ✘ Dip (Magnetic Inclination)/degree -11.39
- ✘ Modip (Modified Dip)/degree -11.26
- ✘ Solar Sunspot Number (12-months running mean) Rz12 10.5
- ✘ Ionospheric-Effective Solar Index IG12 2.3
- ✘ F2 peak electron density (NmF2/cm-3= 1000.0) provided by user
- ✘ F2 peak height (hmF2/km=100.0) provided by user

# OUTLINE

---

- ✘ Total electron content overview
- ✘ Objective of the study
- ✘ IMPORTANCE OF TEC
- ✘ Results
- ✘ Conclusion

# TOTAL ELECTRON CONTENT OVERVIEW

---

- ✘ TEC is the number of electrons in a volume of one square meter in cross-section, extending along a ray path from a satellite to a ground receiver

$$\text{TEC} = \int_p N(s) ds$$

$N(s)$  is the electron density

- ✘ TEC has a unit of electrons per square meter, where  $10^{16}$  electrons/m<sup>2</sup> = 1 TEC unit (TECU).

# IMPORTANCE OF TEC

---

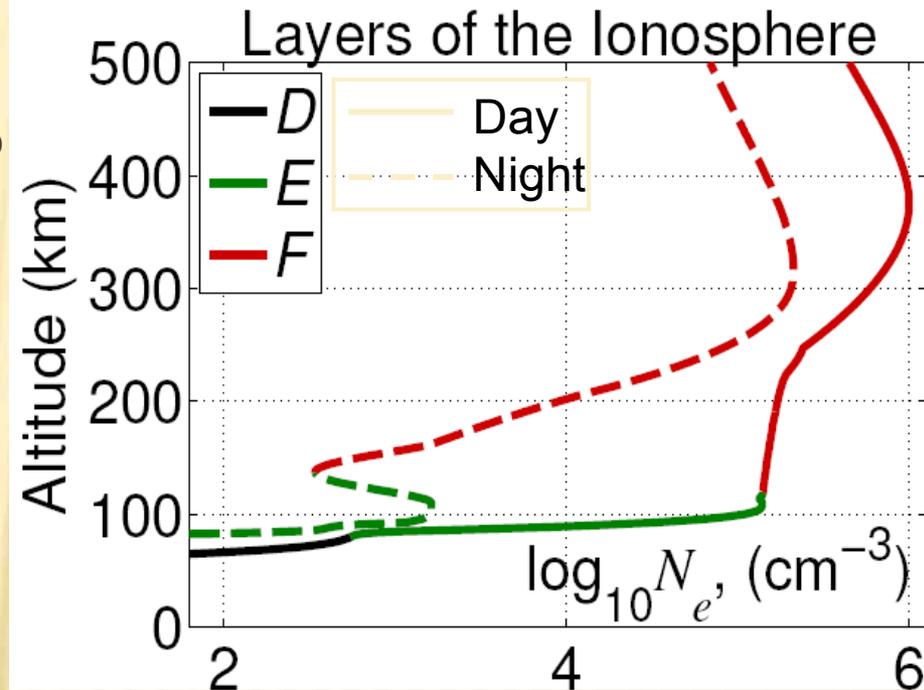

TEC is an important descriptive quantity for the ionosphere of the Earth

TEC is also significant in determining the scintillation and group delay of a radio wave through a medium.

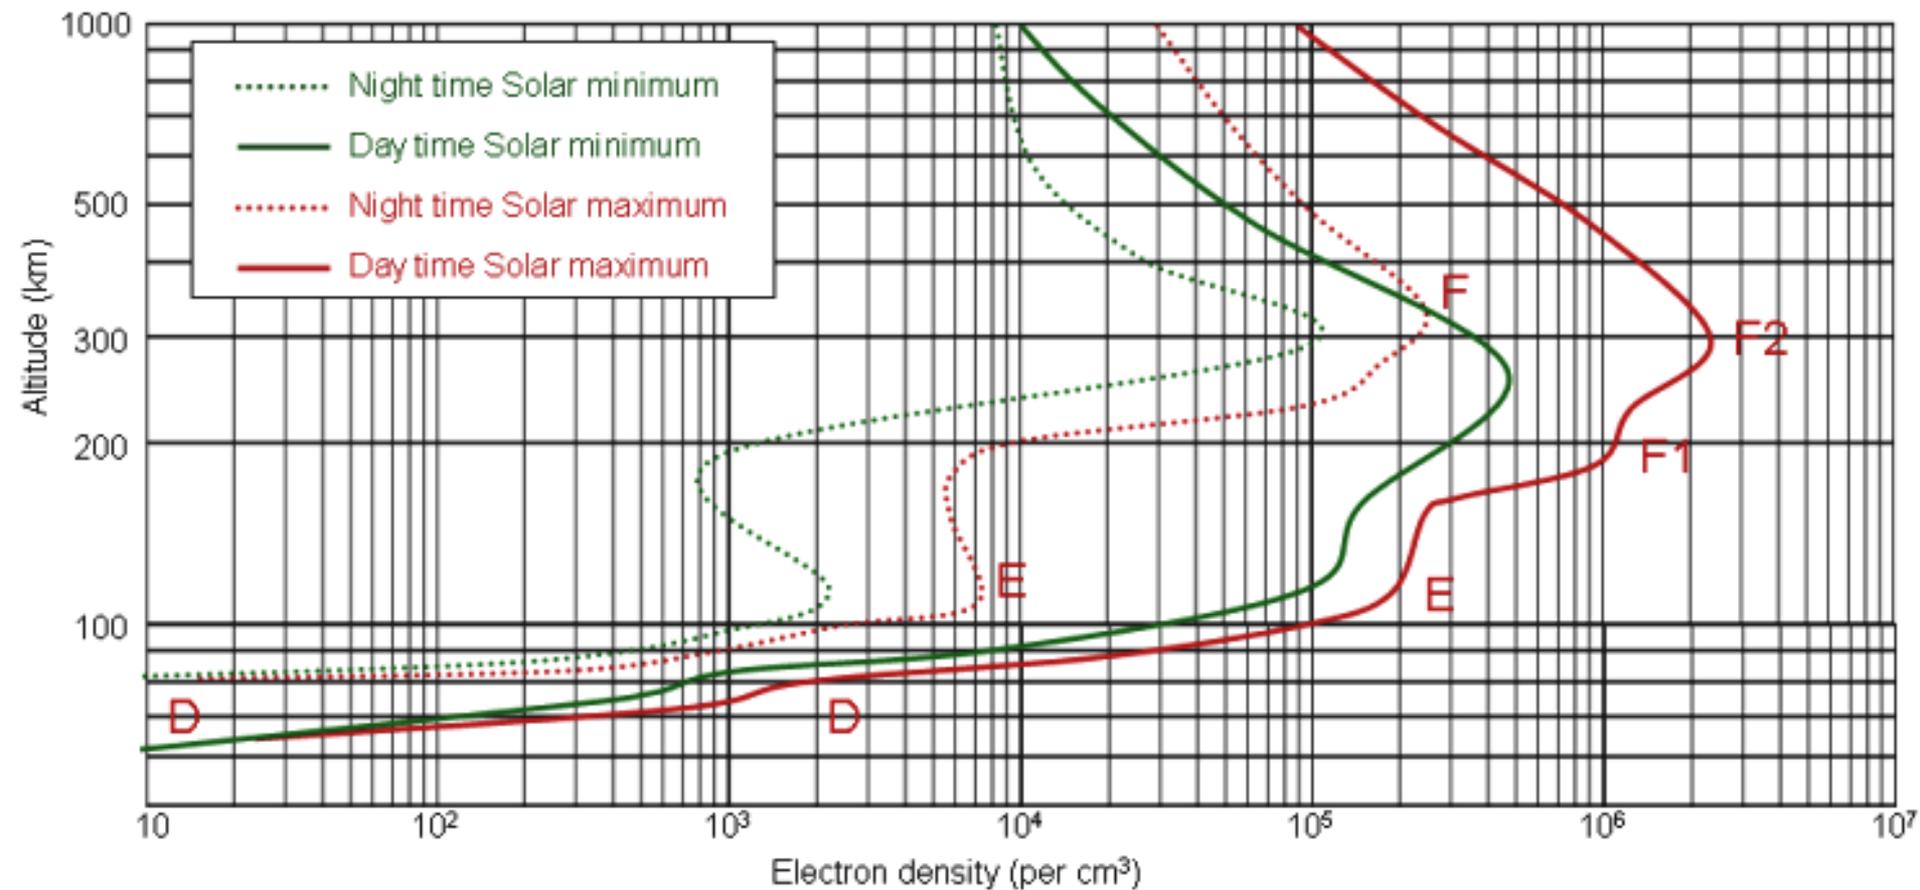

TEC is a key parameter to navigation and communication

# OVERVIEW OF THE IONOSPHERE

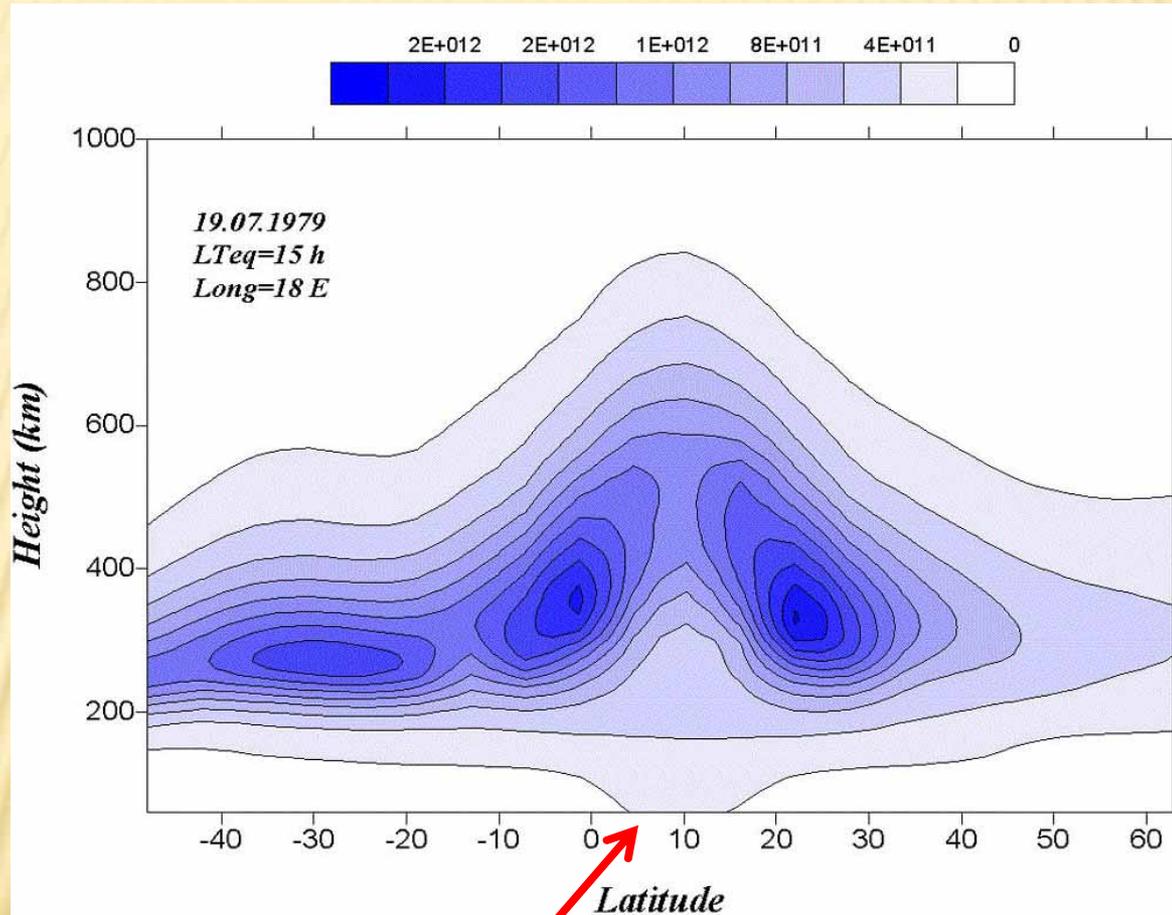

- ✘ Structure of ionosphere continuously changing
  - + Varies with day/night, seasons, latitude and solar activity
- ✘ Essential features are usually identifiable
- ✘ Ionosphere divided into layers, according to electron density and altitude
  - + D Layer (or D Region)
  - + E Layer
  - + F Layer
- ✘ Several reasons for distinct layers
  - + Solar spectrum energy deposited at various altitudes depending on absorption of atmosphere
  - + Physics of recombination depends on density of atmosphere (which changes with altitude)
  - + Composition of atmosphere changes with altitude

# SOLAR ACTIVITY VARIATIONS

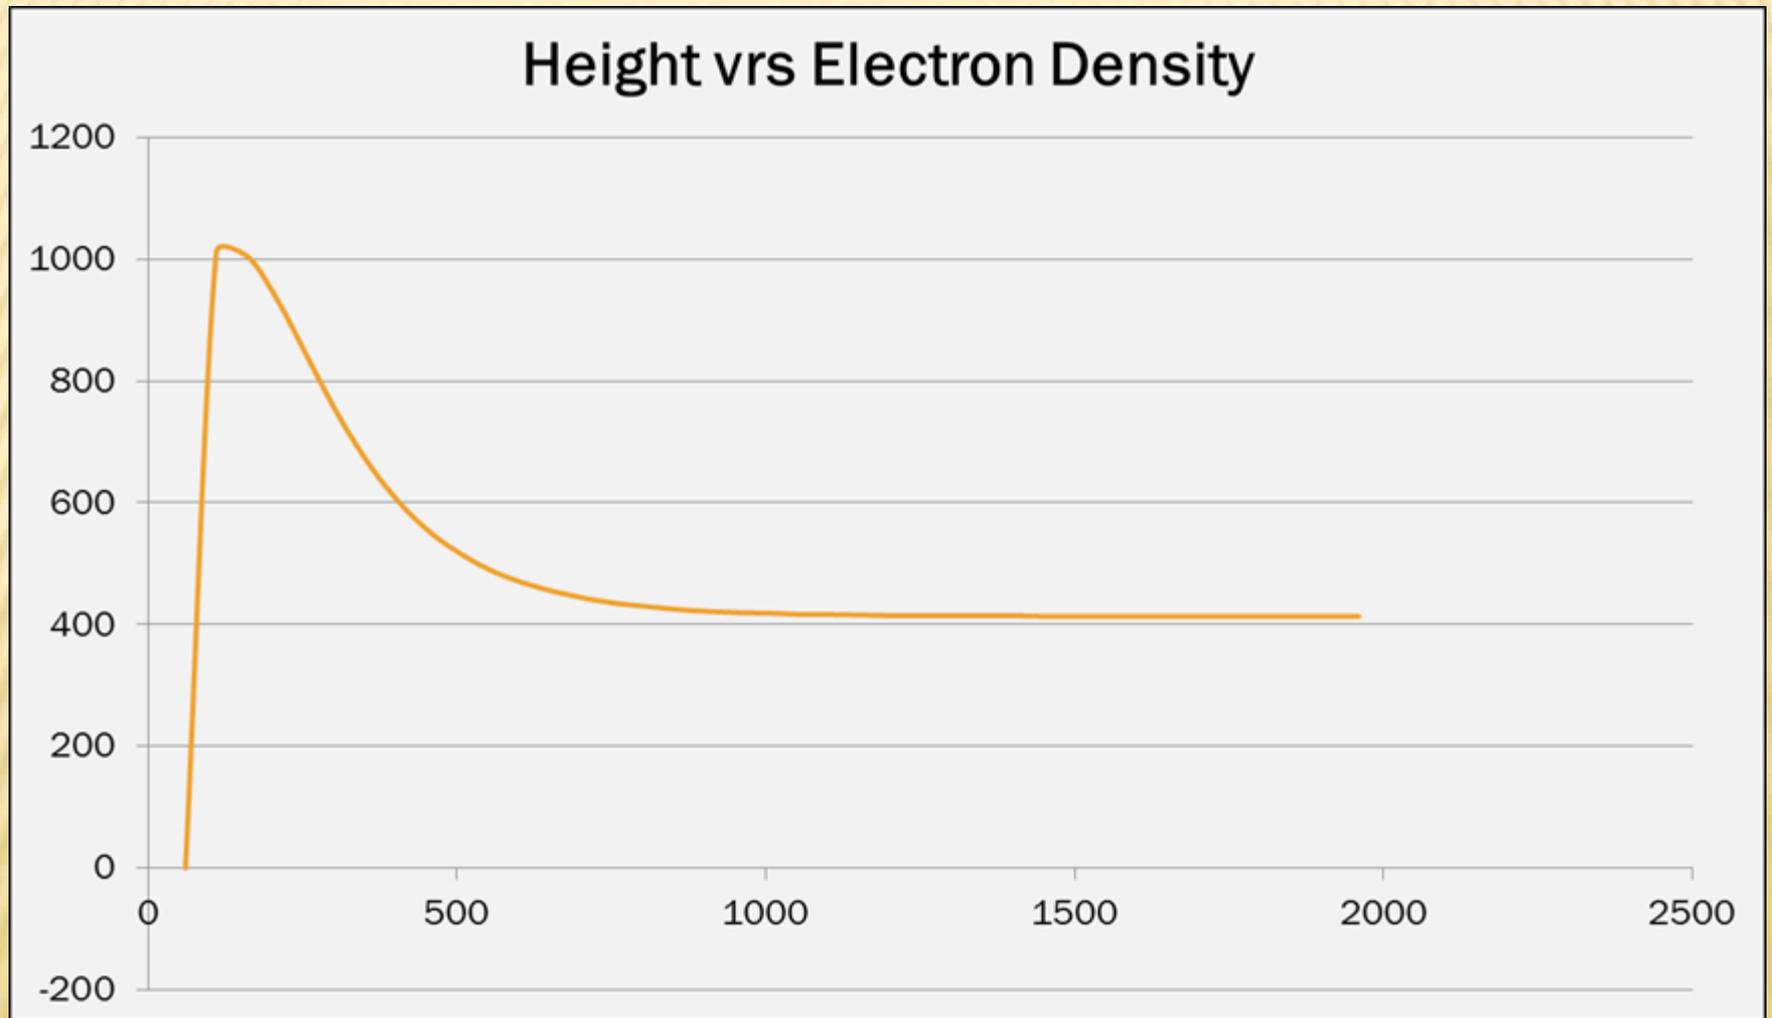

# LATITUDINAL CROSS SECTION OF THE IONOSPHERIC ELECTRON DENSITY

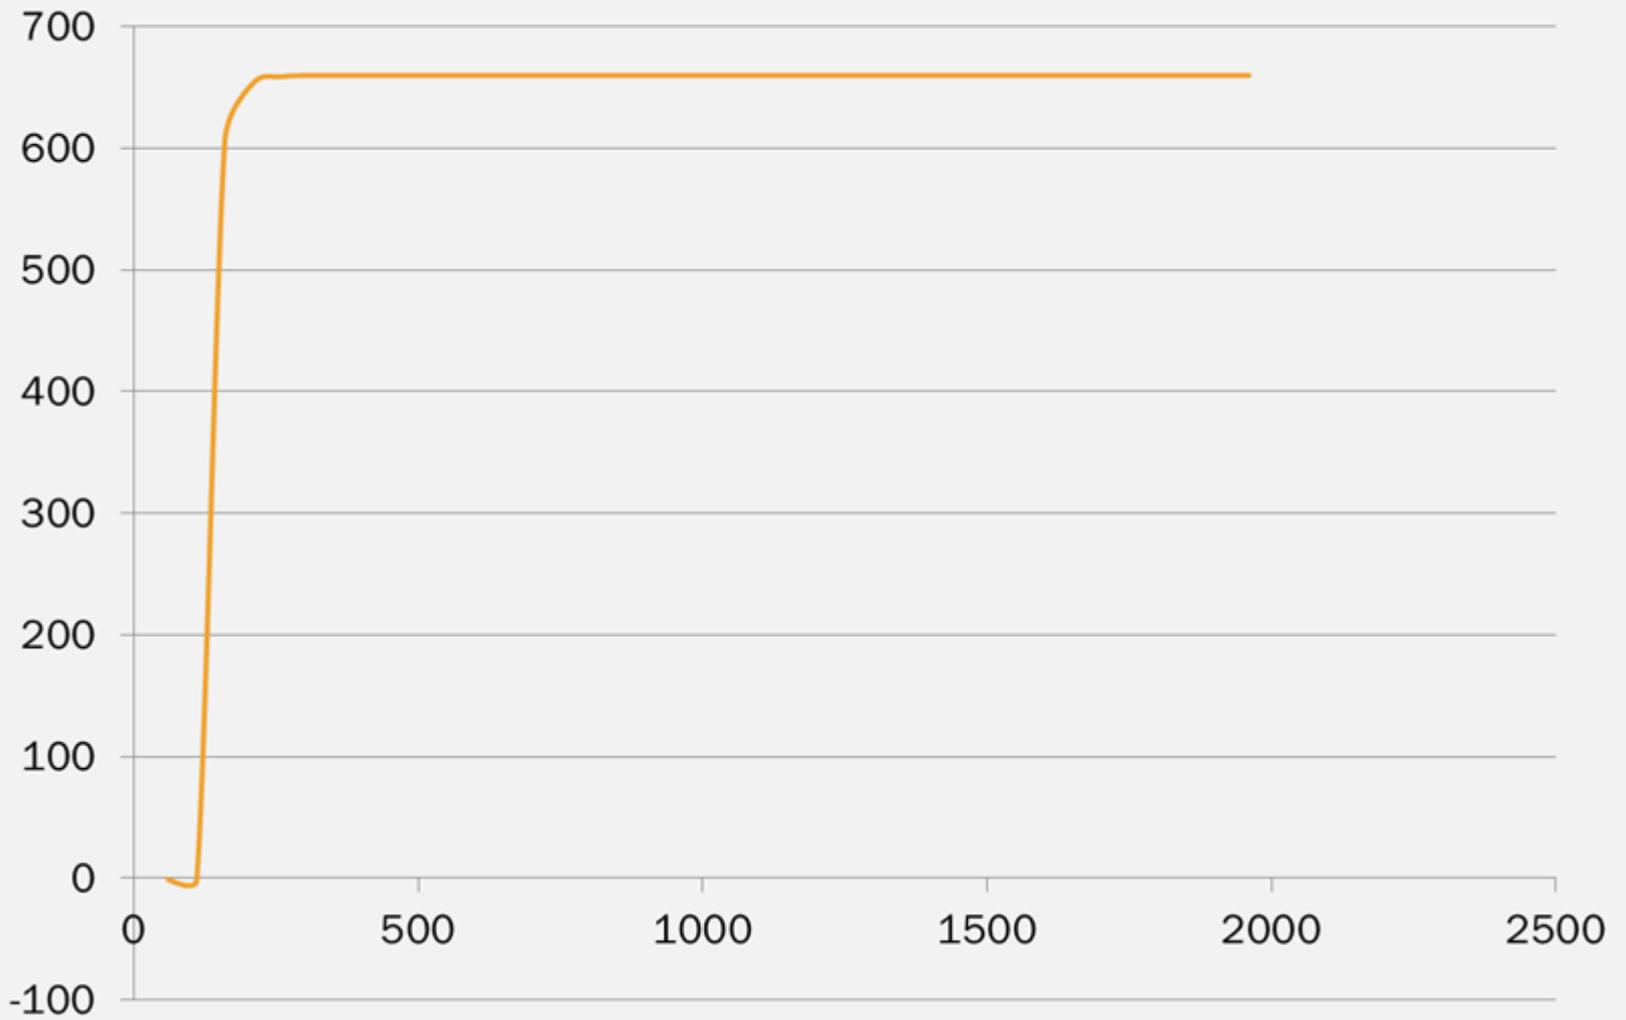

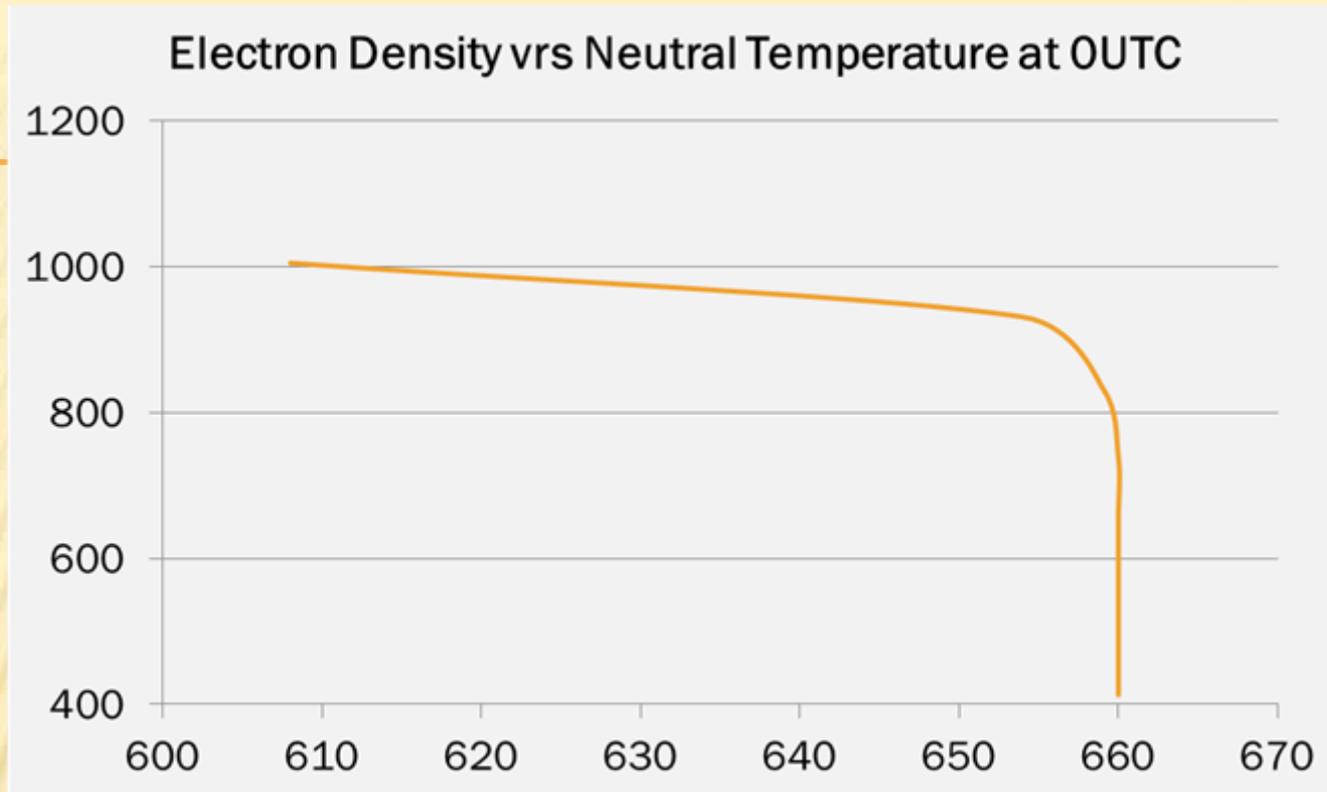

Ghana lies (5N -11N)

# RESULTS

## Height vrs Neutral Temperature

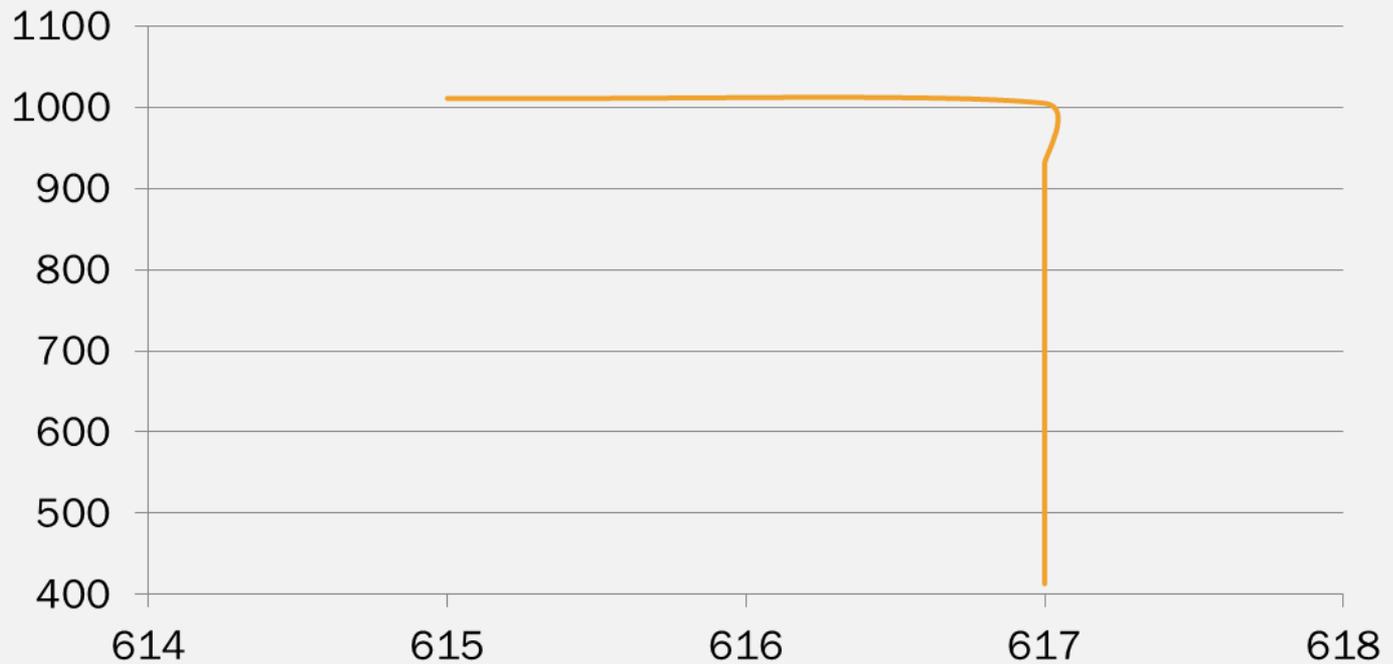

Zero UTC shows that electron density decreases gradually from 1005  $\text{Necm}^{-3}$  to 834  $\text{Necm}^{-3}$  with increase in temperature in a range of 608K to 654K.

At a constant temperature of 654K, electron density decreases sharply from 800  $\text{Necm}^{-3}$ , implying that at that particular temperature, electron density keep decreasing.

## Electron Density vrs Neutral Temperature at 6UTC

Similar characteristics is seen in the graph at 6 UTC but the sharp decreases at  $800\text{Necm}^{-3}$  occur at an earlier temperature of 617K, which has been explained with the effect of solar activities.

# CONCLUSION

---

Time of the day has significant effect on Electron Density.

*Special thanks*
