2013

Abstract:

UNB Ionospheric Modeling Techniques computes TEC from GPS observables at both L1 and L2 frequencies in order to provide ionospheric corrections to communication, surveillance and navigation systems operating at one frequency. The software estimates the coefficients of a linear spatial approximation of TEC over each station in addition to the satellite and receiver differential biases, modeling the ionospheric measurements from a dual frequency GPS receiver with the single-layer ionospheric model. The GPS data of IGS Hyderabad station (17.41°N , 78.55°E), Bangalore (13.02°N , 77.57°E) and Kolhapur station (16.8°N , 74.2°E) have been used to measure Total Electron Content (TEC) of the ionosphere during the period of different geomagnetic storm events. The effect of the geomagnetic storm on ionosphere shows an increase in the VTEC values, followed by sudden decrease in Dst values in some storm cases. In the next few years there will be ample opportunities to study in detail solar- terrestrial events using UNB Ionospheric Modeling Techniques for better understanding of the effect of solar activity on Total Electron Content (TEC) at low latitudes.

Key Words: GPS, Total Electron Content, Ionosphere

The TEC depends on the geographic latitude, longitude, local time, season, geomagnetic activity and viewing direction

To account for the ionospheric delay, the GPS receivers employ two L-Band frequencies ($L1=1575\text{ MHz}$ and $L2=1227\text{ MHz}$).

The TEC can be estimated, either by using GPS carrier phase or pseudo-range delays.

STEC and VTEC

$$\begin{aligned} STEC &= \frac{sv}{r} \int N dr = \left(\frac{f_2^2}{f_1^2 - f_2^2} \right) \frac{2 f_1^2}{K} \Delta P_{L1,2} \\ &= 9.509 E16 \Delta P_{L1,2} \end{aligned}$$

$\Delta P_{L1,2} = P_{L1} - P_{L2}$ where P_{L1} and P_{L2} are pseudo ranges on L1 and L2 respectively

Differential phase advance STEC

$$\begin{aligned} STEC &= \frac{sv}{r} \int N dr = \left(\frac{f_2^2}{f_1^2 - f_2^2} \right) \frac{2 f_1^2}{K} \Delta \Phi_{L1,2} \\ &= 9.509 E16 \Delta \Phi_{L1,2} \end{aligned}$$

$\Delta \Phi_{L1,2} = \Phi_{L1} - \Phi_{L2}$ where Φ_{L1} and Φ_{L2} are phase measurements on L1 and L2 respectively.

Slant TEC to Vertical TEC

$$TEC = \text{slant TEC} \times map$$

$$map = \sqrt{1 - \left(\frac{h_{sp} \cos \varepsilon}{h_{sp} + R_E} \right)^2}$$

R_E -Radius of the Earth

h_{sp} - height of the ionospheric pierce point

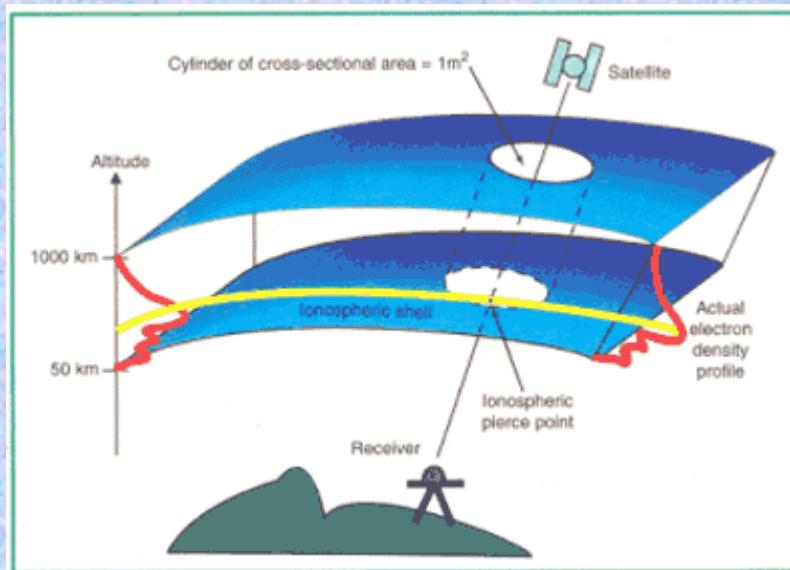

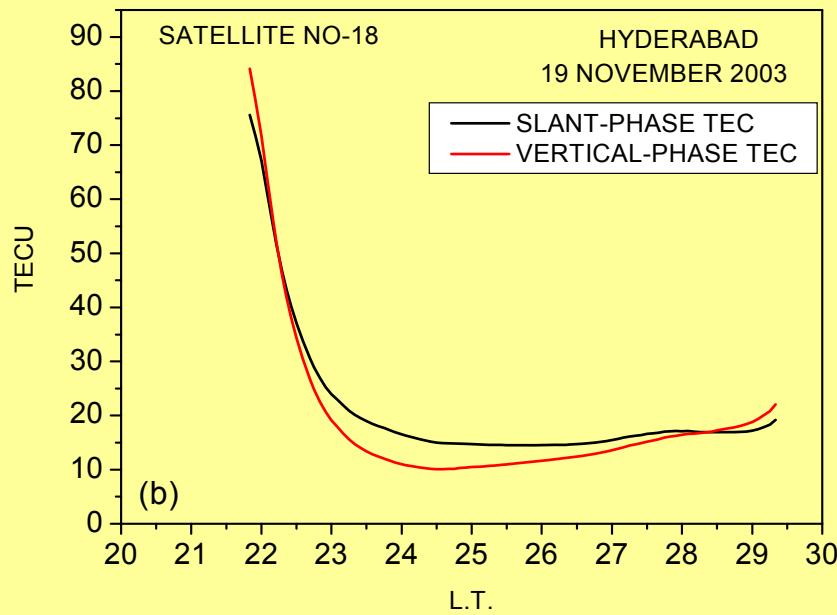

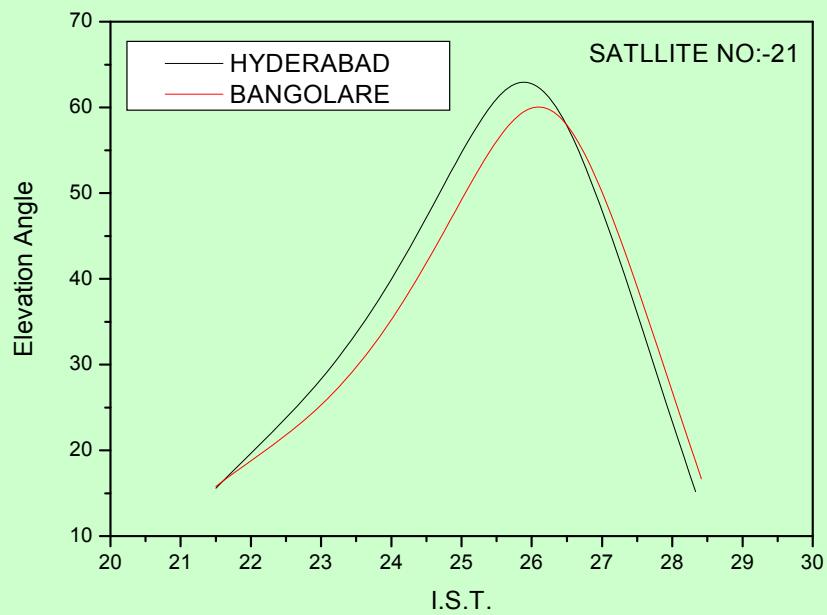

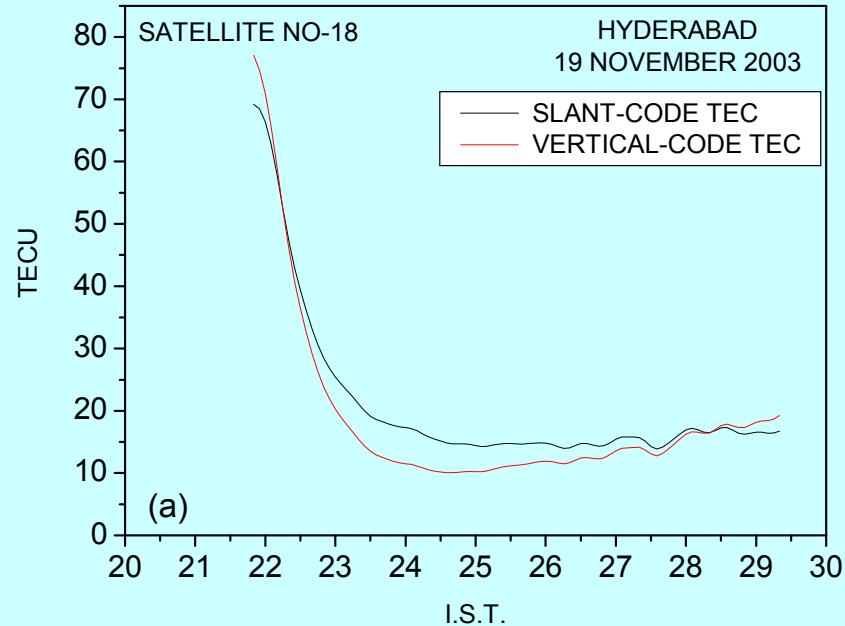

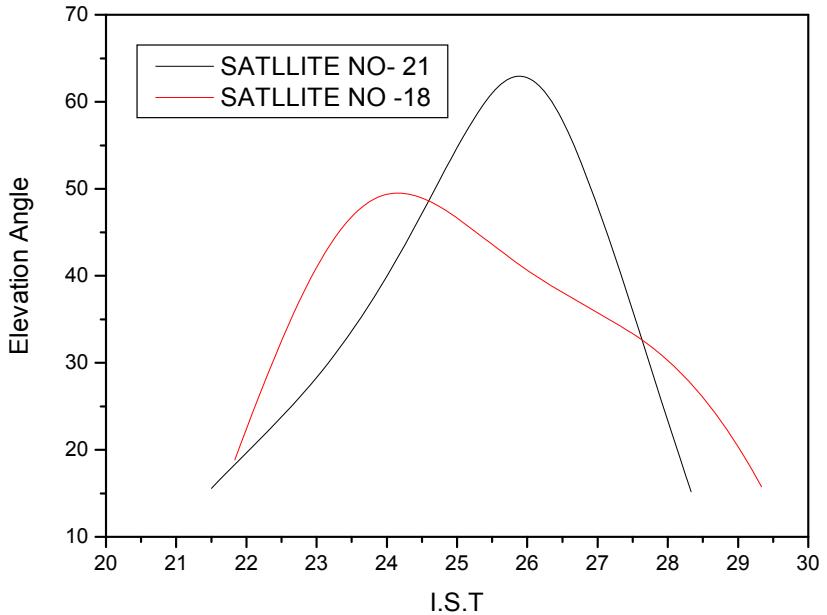

Fig.The ionosphere is represented as thin shell. The variation of electron density shown in red color and the peak value represent the F layer (shown as yellow line) (Fedrizzi et al, 2002)

GPS data Analysis

The UNB Ionospheric Modelling Technique

Uses single layer ionospheric model (Komjathy, 1996)

$$I(t) = M(e)[a_0(t) + a_1(t)dl + a_2(t)df] + b_r + b^s$$

$I(t) : L_1 - L_2$ Phase-levelled ionospheric measurement in TECU,

$M(e)$: elevation angle mapping function,

$[a_0(t) + a_1(t)dl + a_2(t)df]$: spatial linear approximation of TEC,

$b_r + b^s$: Receiver plus Satellite instrumental differential delays.

- Solar-geomagnetic reference frame.
- 5 by 5 longitude/latitude degree grid spacing maps.
- TEC at each grid node computed using the 4 closest stations.

The UNB Ionospheric Modelling Technique contain 4 modules, which will be here referred by the name of the main executables:

- module "prep"
- module "post_glob"
- module "tecmap"
- module "topiri"

Each module is comprised by the main program, subroutines, executables, etc.

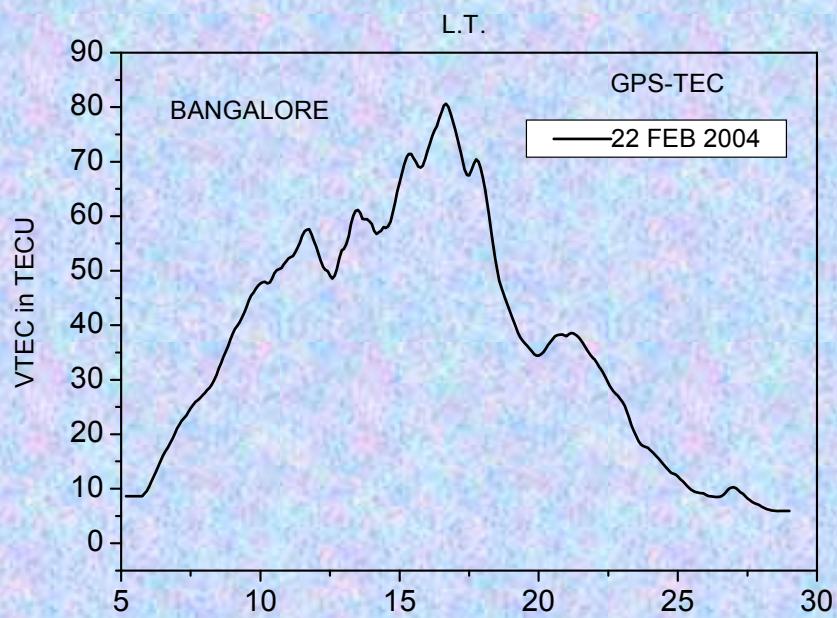

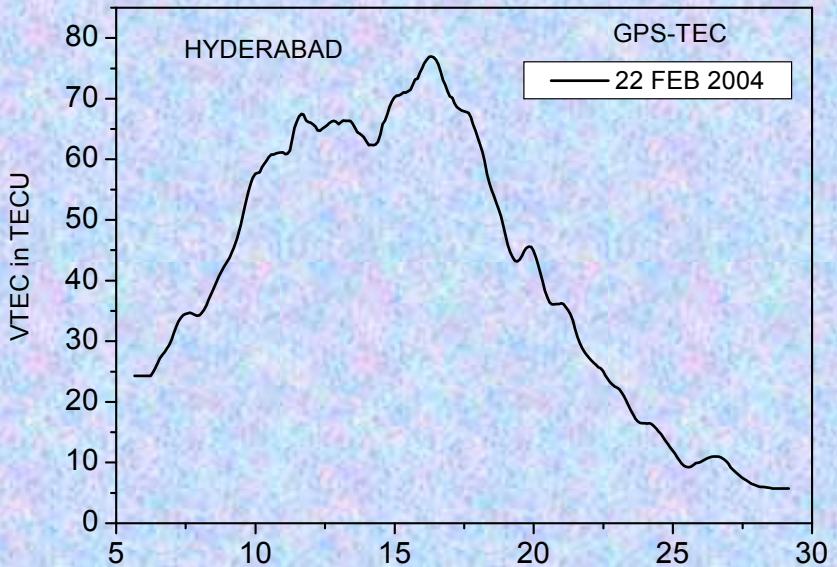

Fig.The VTEC for Hyderabad and Bangalore station on 22 February 2004 respectively using UNB Ionospheric Modeling Technique

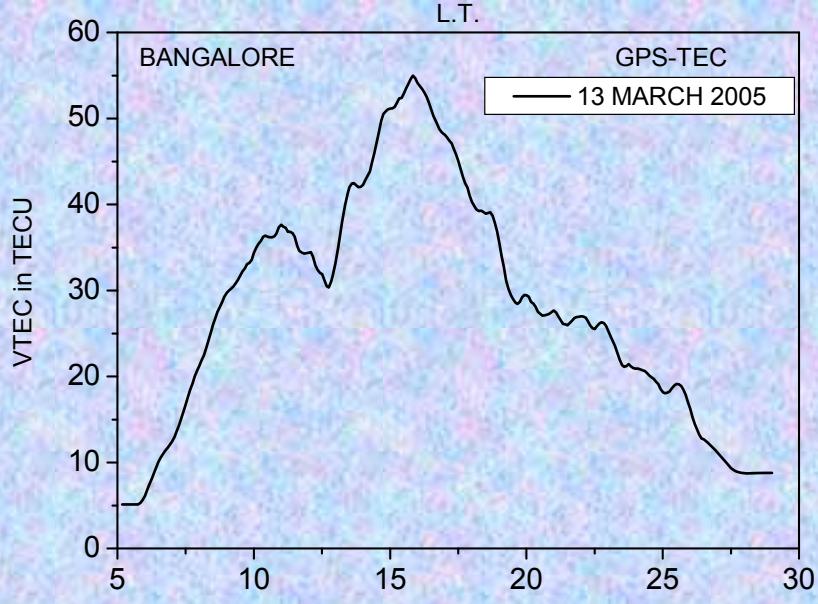

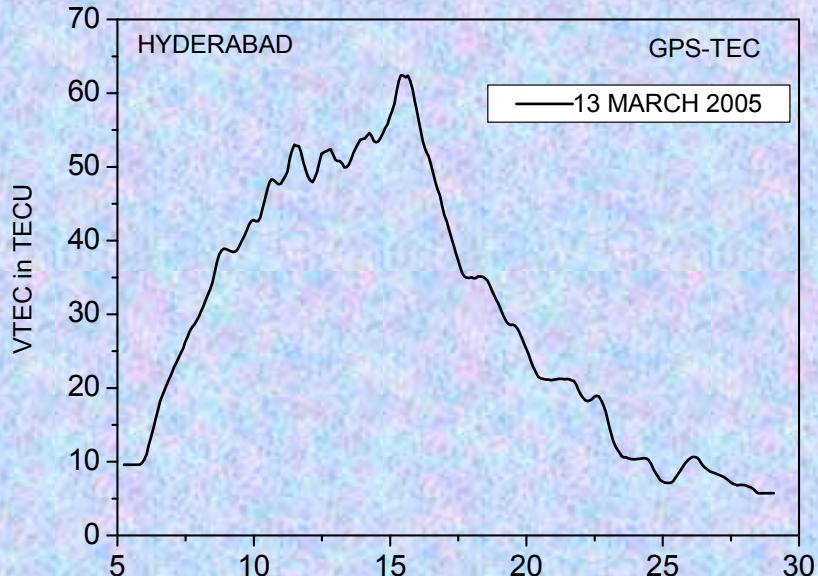

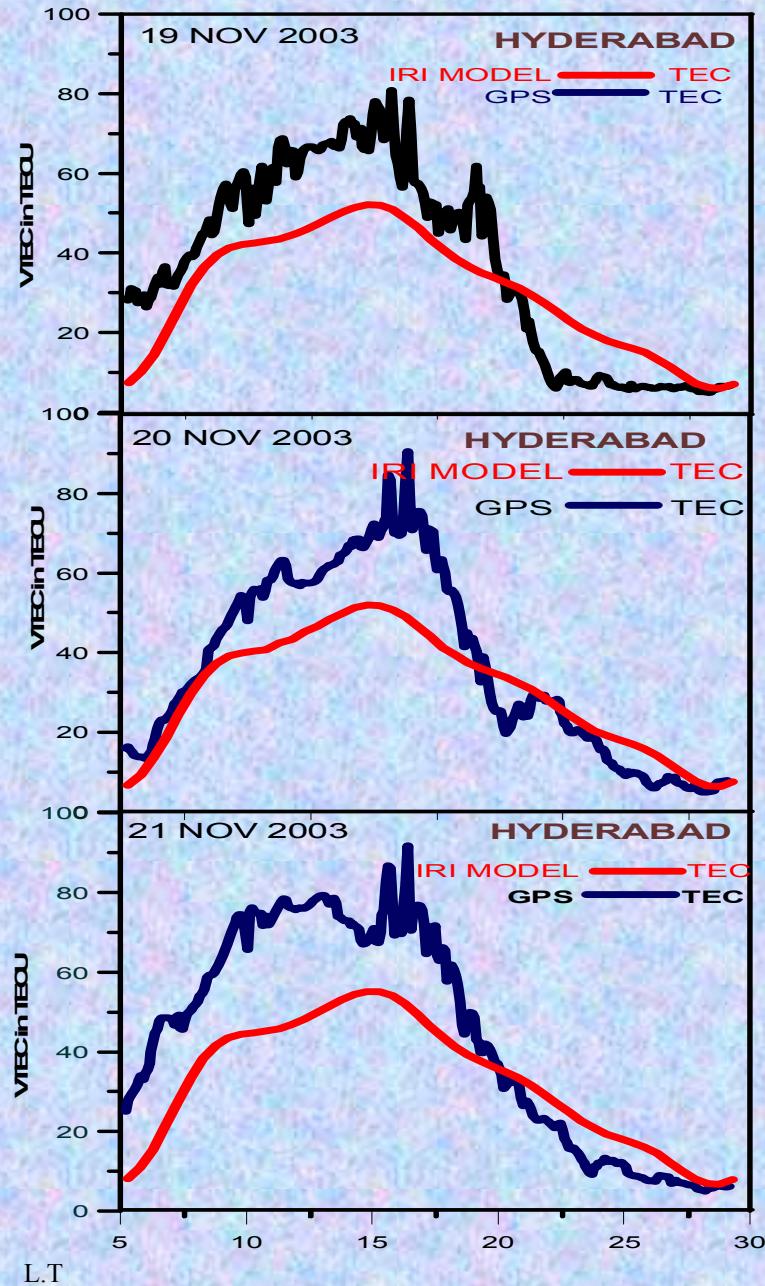

Fig.The VTEC for Hyderabad and Bangalore on 13 March 2004 using UNB Ionospheric Modeling Technique

Comparision between IRI-TEC and GPS-TEC

Plot the VTEC values using IRI2000 model and UNB Ionospheric Modeling Technique for three consecutive days November 19-21, 2003. It is clearly seen that IRI model values underestimate the computed TEC values from GPS data mostly during day time hours. However, the agreement is good between 20:00 to 06:00 hours LT. This model seems to give less accurate results for Indian region **UNB results are much more sensitive to the variations in the ionosphere.**

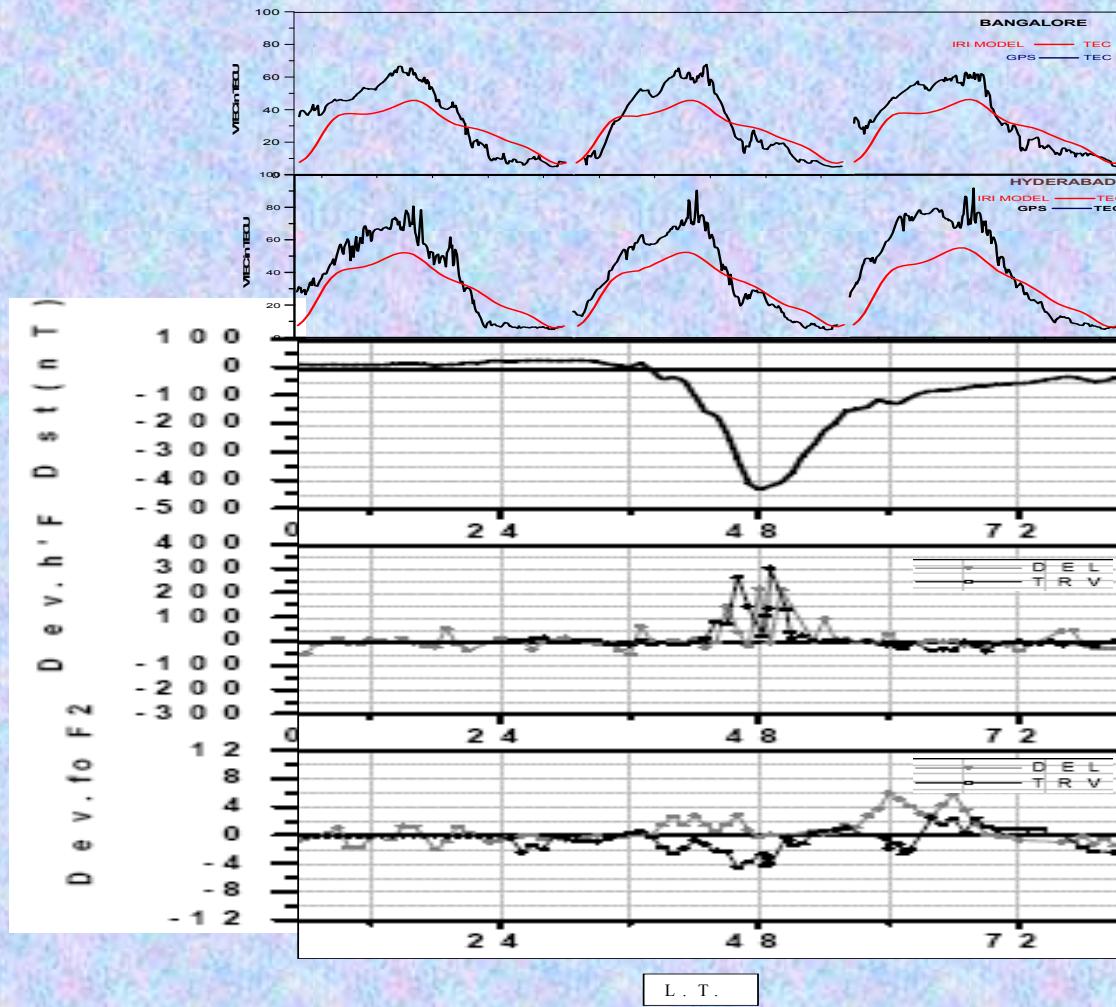

Figure .From top to bottom each panel represents computed VTEC (Bangalore),VTEC with IRI-TEC (Hyderabad), Dst(nT), Deviation of h'F (Delhi and Trivendrium) and in bottom panel deviation of foF2 (Delhi and Trivendrium)

Storm: 13-17 May 2005

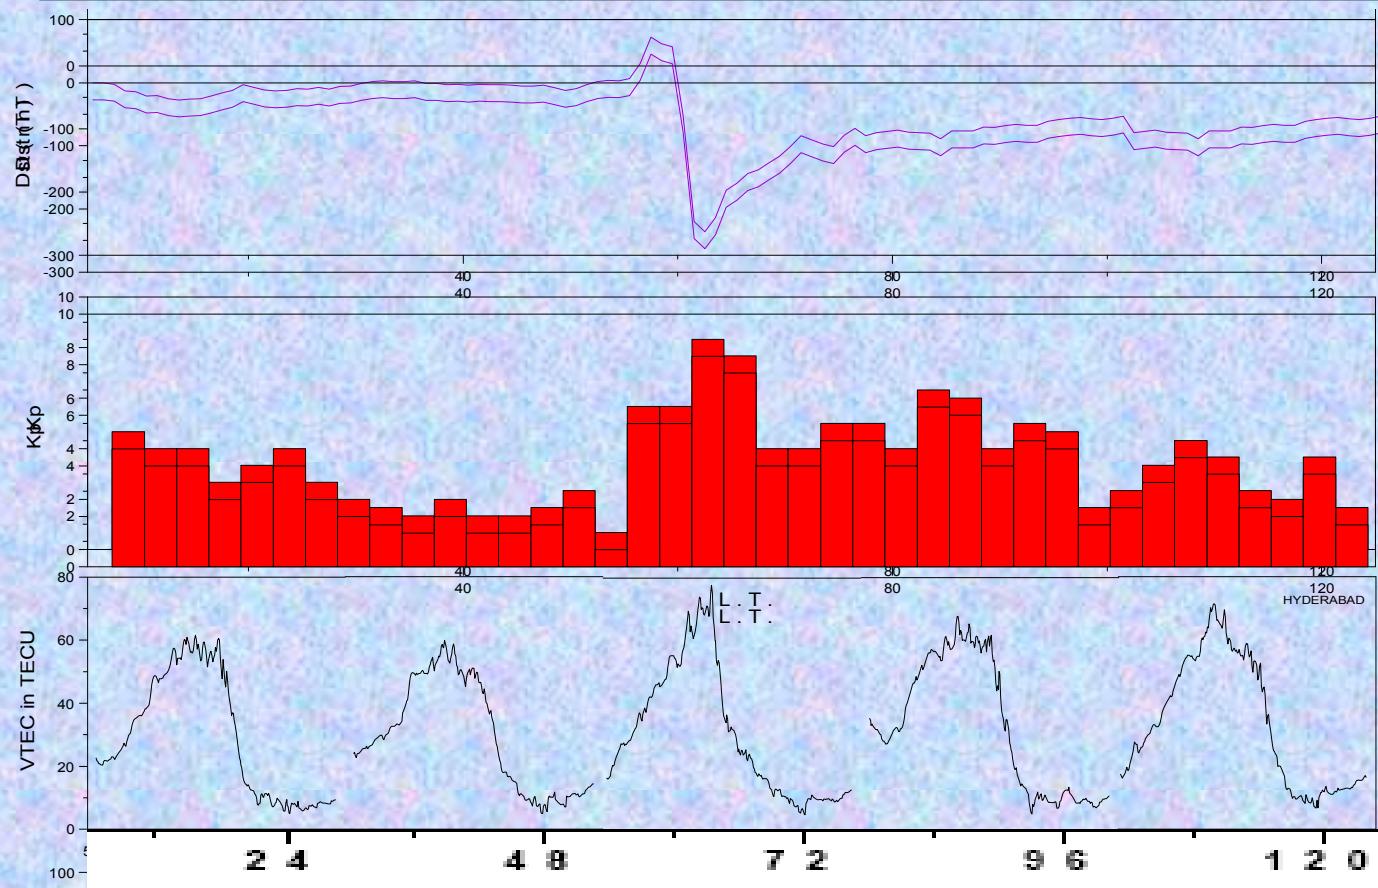

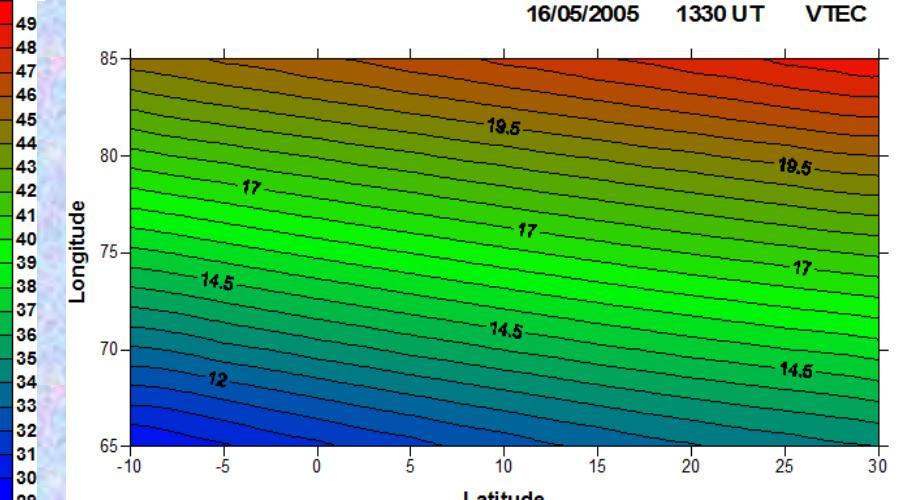

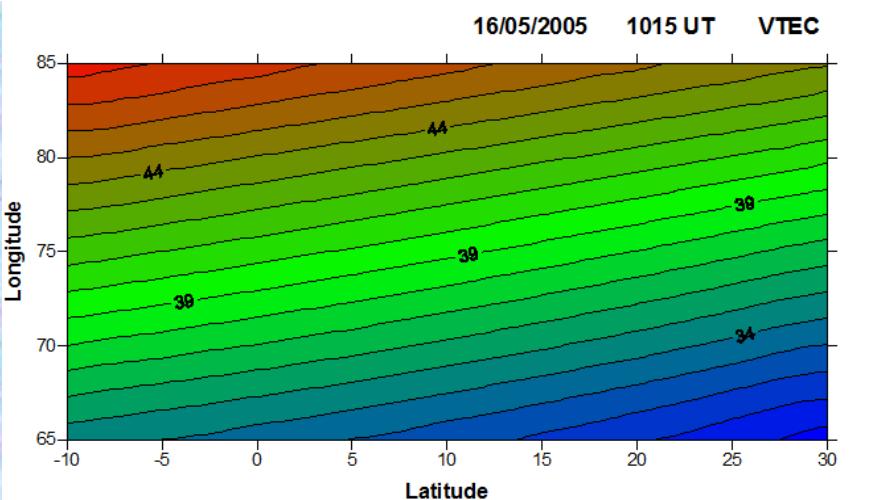

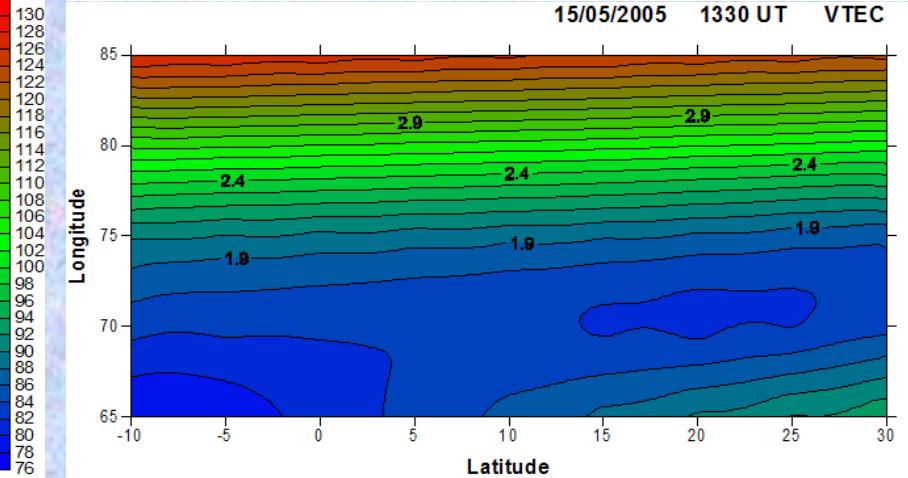

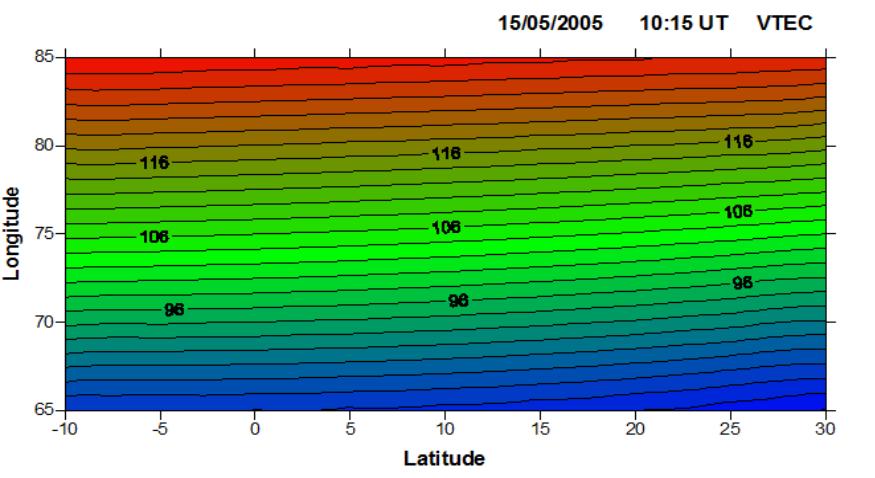

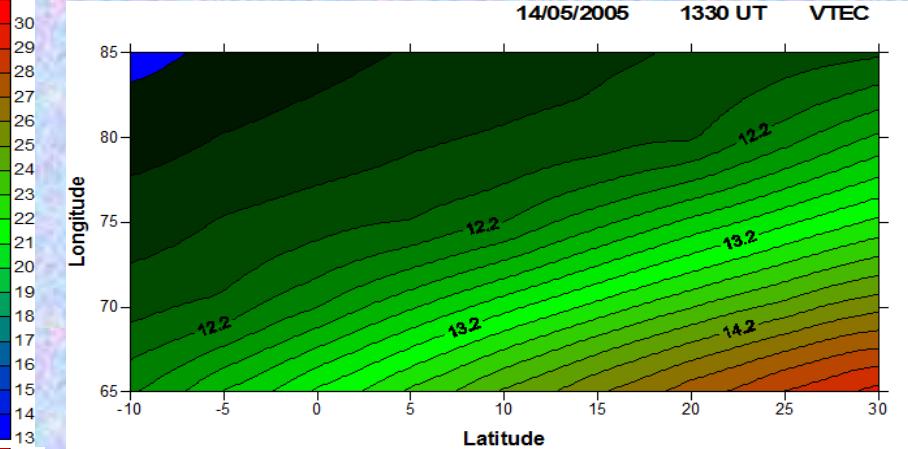

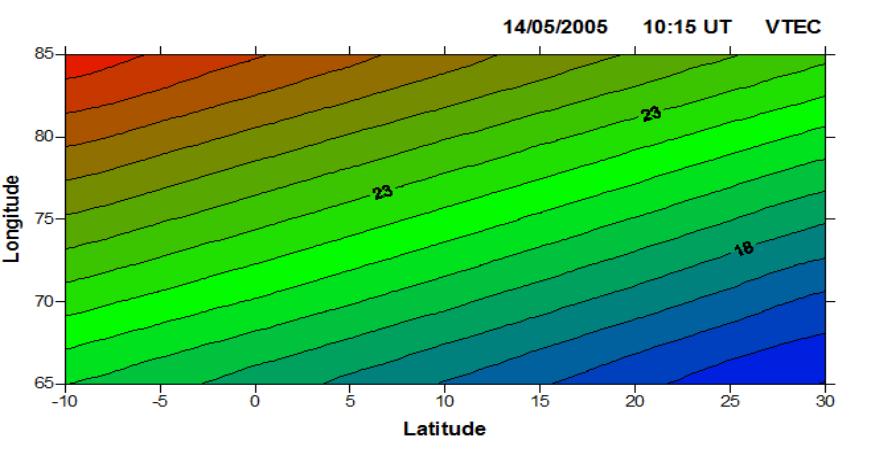

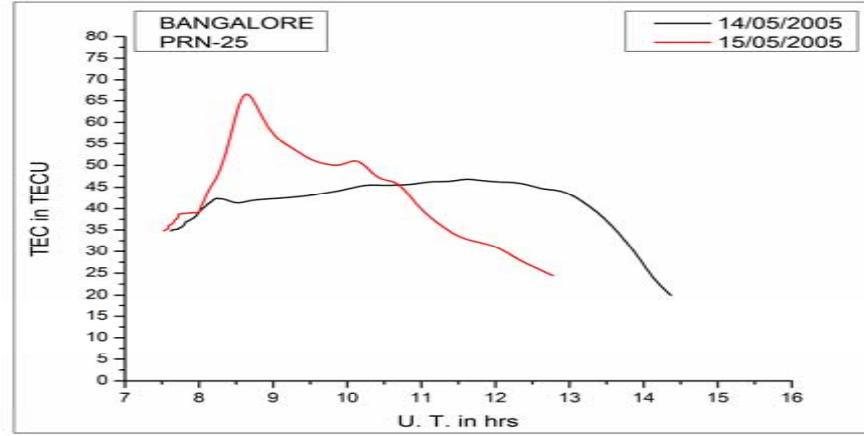

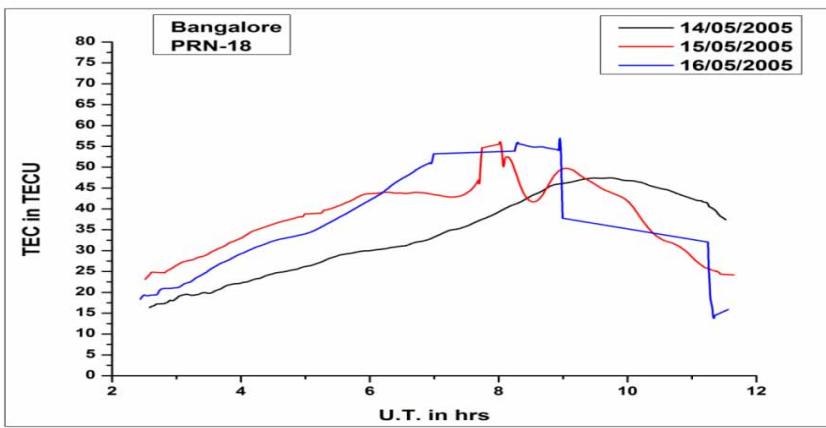

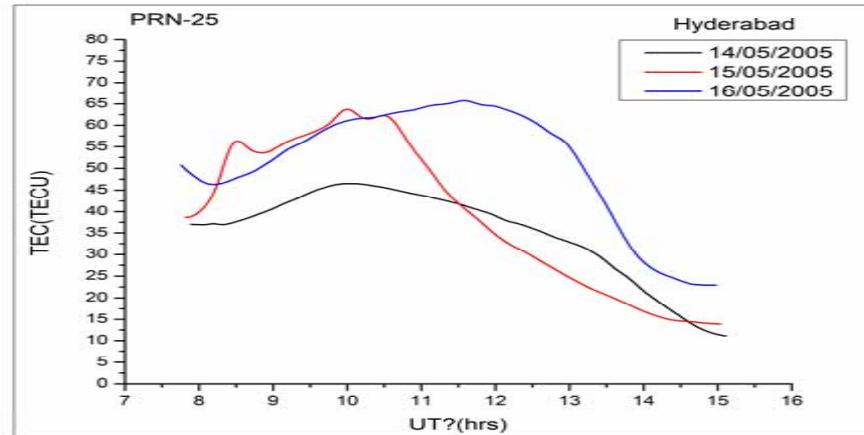

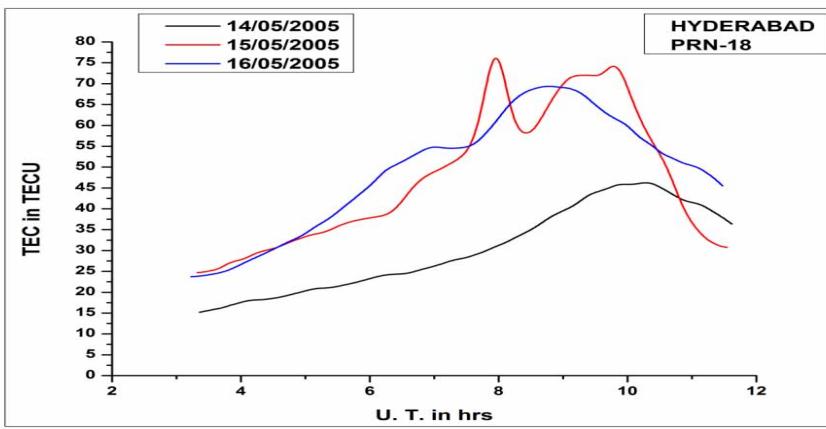

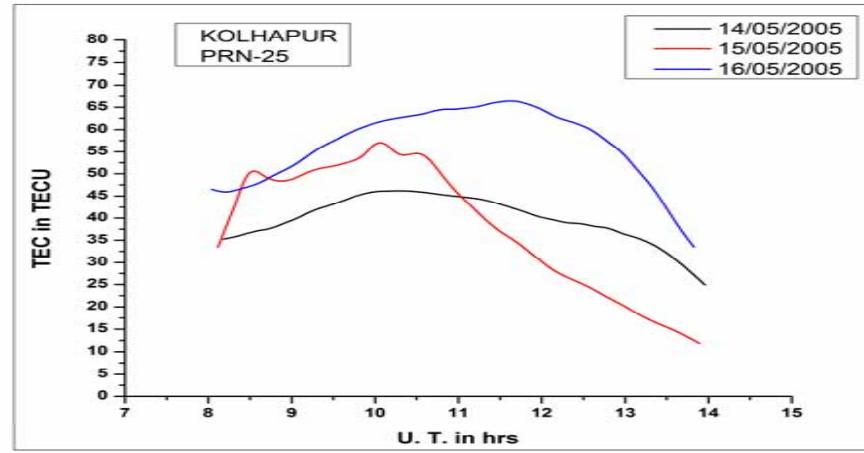

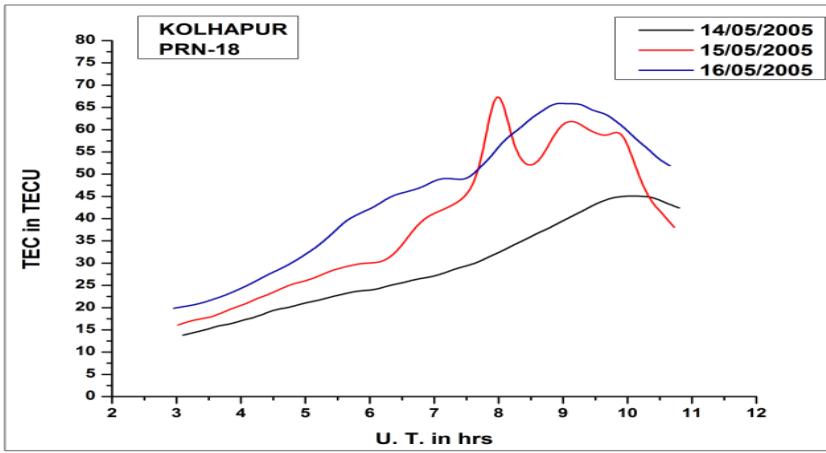

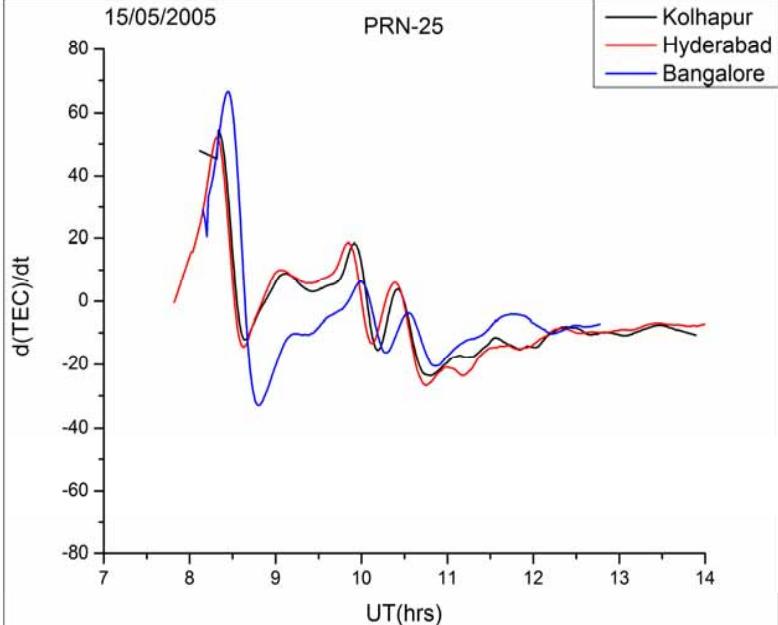

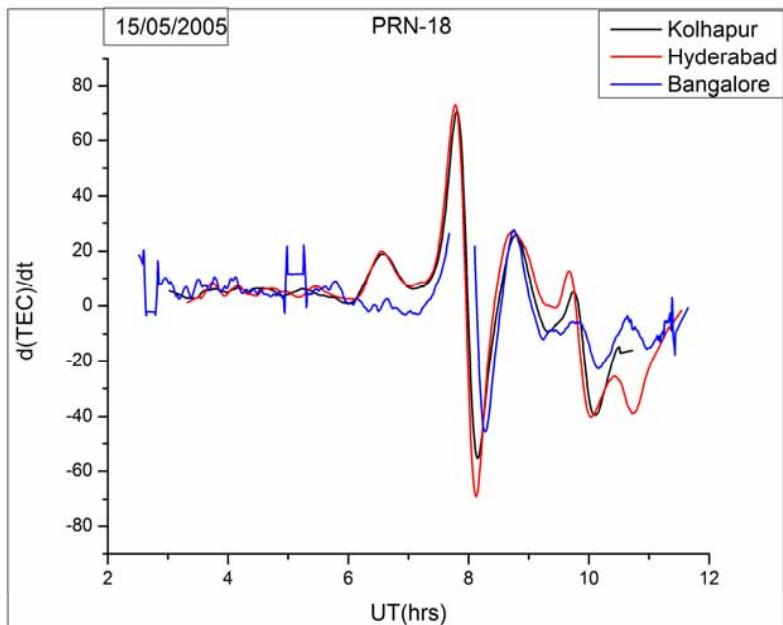

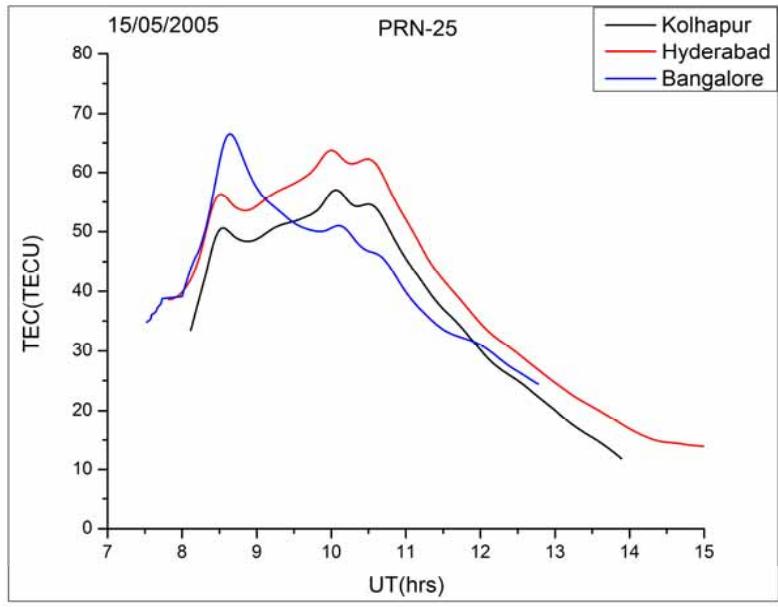

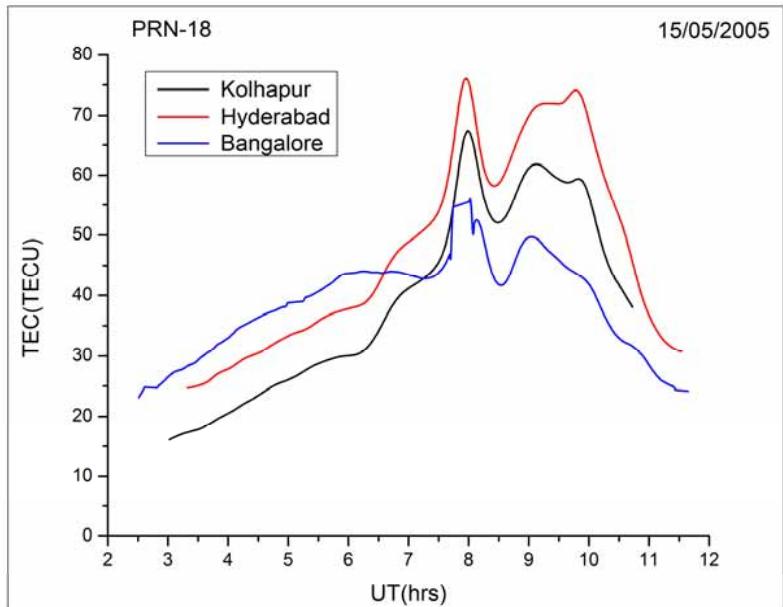

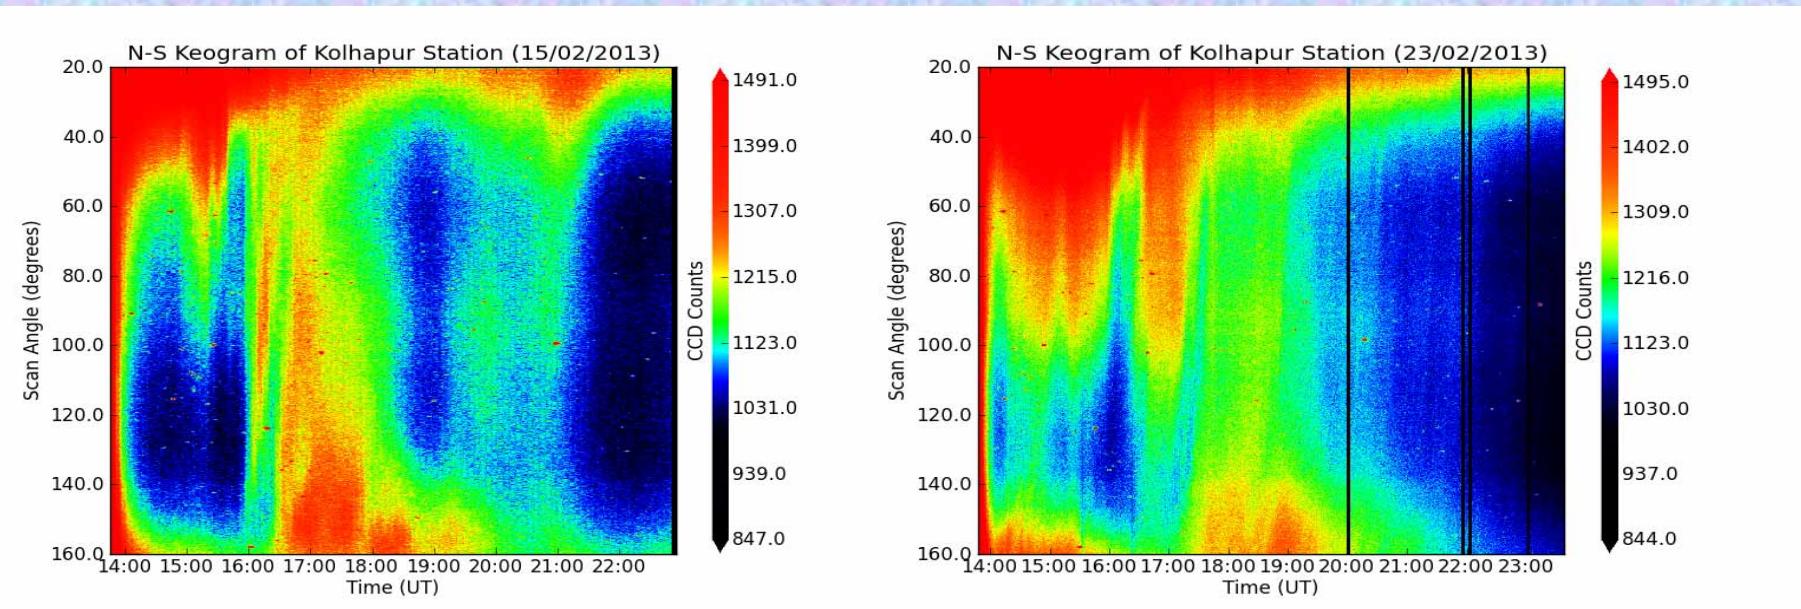

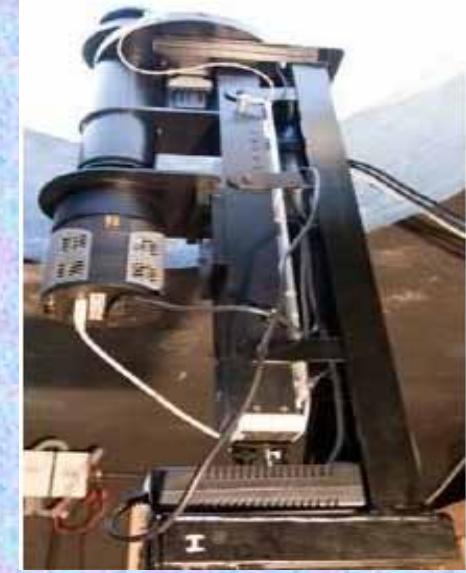

Figure. From bottom to top panel shows VTEC for Hyderabad , bottom panel shows Kp index, and the Dst (nT) index on 13-17 May 2005

The Python All-Sky Image Library (PASKIL) is a collection of Python modules designed to manipulate and process all-sky images. Its plug-in architecture enables it to process images and image meta-data of any format. [Niel Peter, 2009]

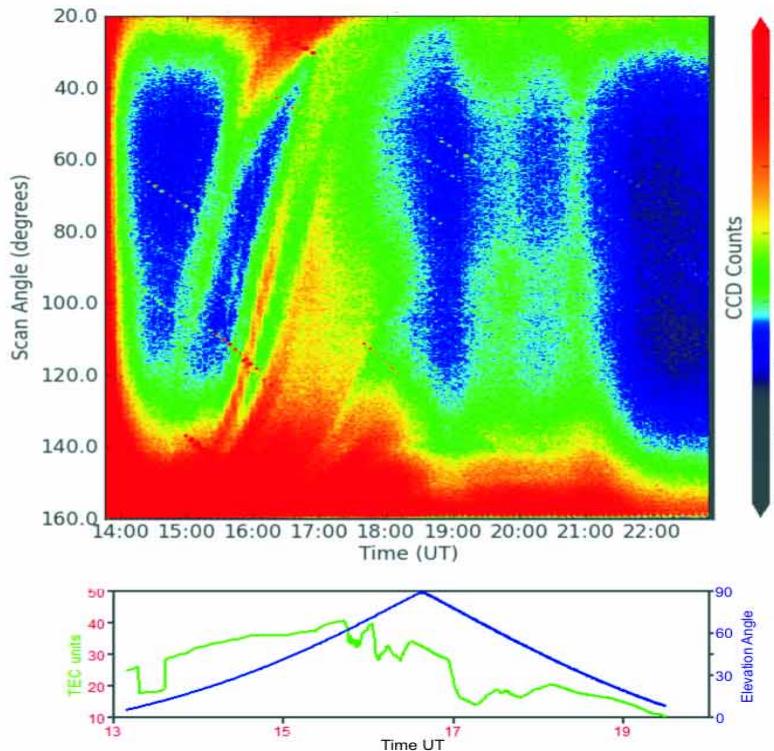

Fig.1: Night Airglow OI630 nm (E-W Keogram of Kolhapur Station) and GPS-TEC observations of Hyderabad station on 15/02/2012.

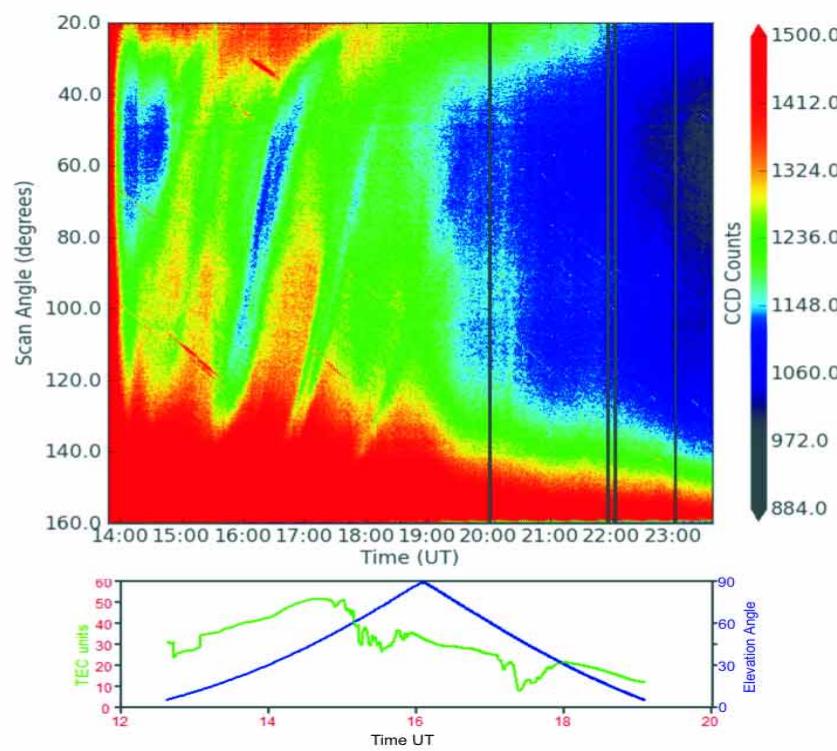

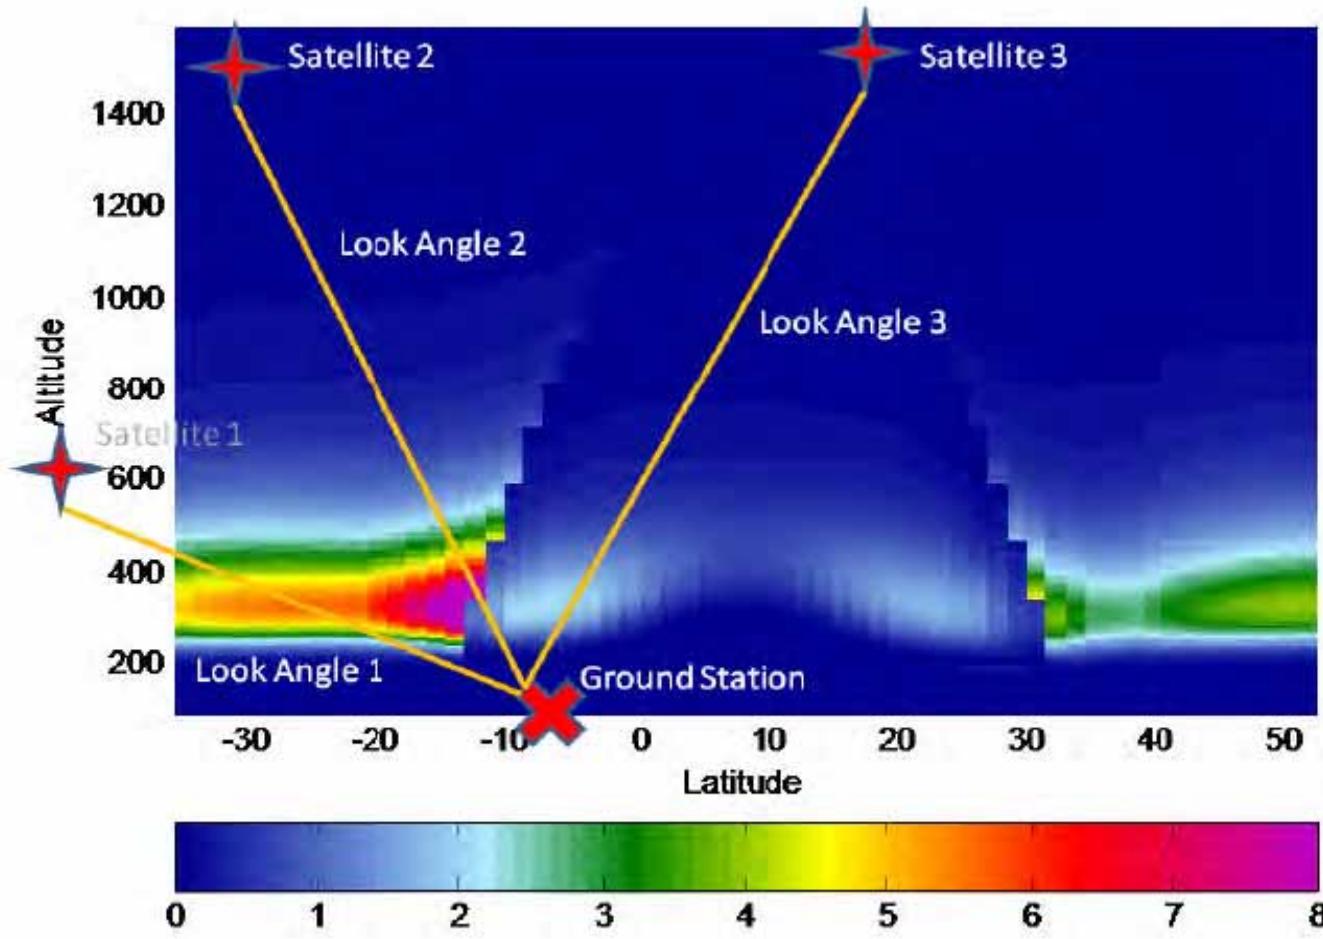

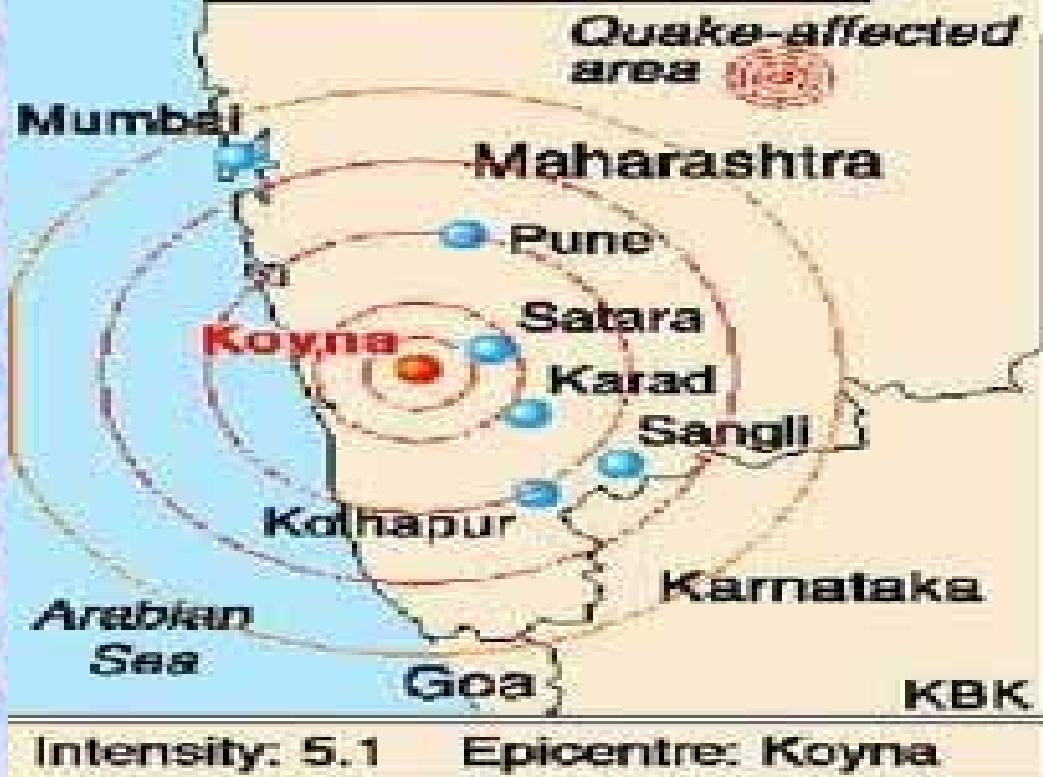

Fig.2: Night Airglow OI630 nm (E-W Keogram of Kolhapur Station) and GPS-TEC observations of Hyderabad station on 23/02/2012.

Simultaneous observations of OI630 nm and TEC were carried out using a CCD based All-Sky Imaging system and GPS system respectively during the month of February /April -2012 at low latitude station Kolhapur (16.8°N , 74.2°E). The radio observation of GPS is also carried out at the nearby station, Hyderabad (17.67°N , 83.32°E) and Bangalore (13.020°N , 77.570°E). The day-to-day variability in the occurrence of Equatorial Spread F (ESF) or Equatorial Plasma Bubble (EPB) is addressed using radio and optical observations from low latitude stations. We have found out the simultaneous occurrence of EPBs in both TEC and OI 630.0 nm emissions using both the techniques.

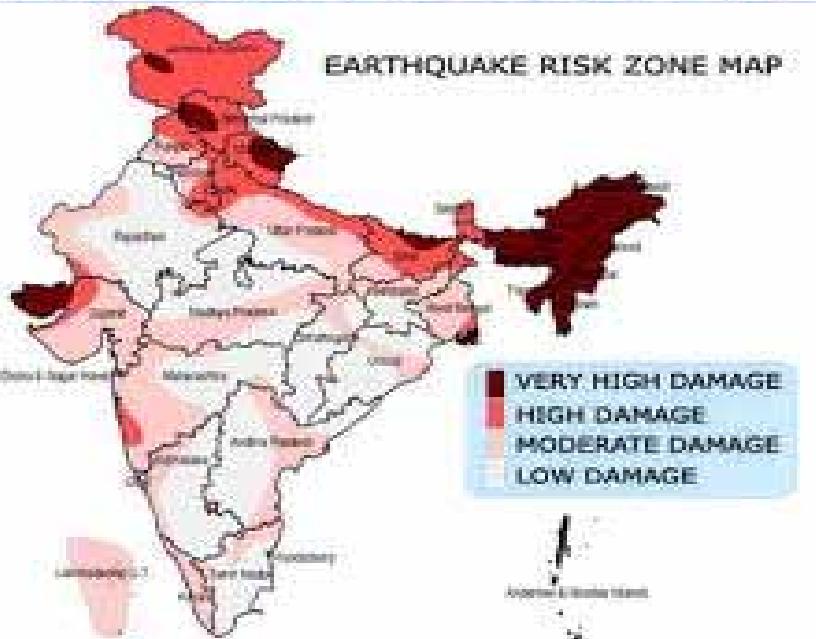

Kenneth R. Fenton, 2011

Koyna-Warna region –Western Maharashtra

The geographical location of Kolhapur is considered to be very unique since it lies midway between the geomagnetic equator, which runs through the southern tip of Indian peninsula and the peak electron density in the F-region of the ionosphere called Appleton anomaly, which lies near the tropic of cancer (23.5°N)

Conclusion

***The results verified the use of UNB-Ionospheric Modeling Techniques for future ionospheric research over Indian Region.

***The methodology to compute TEC from GPS data is being improved, and the continuously increasing number of permanent GPS stations and Ground Based Instrumentation such as Tilting Photometers , All Sky Camera for Night Airglow (OI 630.0 nm emission) study will make possible a more detailed monitoring of the behavior of the ionosphere.

Future Work

To study the possible mechanism of day-to-day variability in the occurrence of EPBs using radio and optical techniques

To study the effects of Plasma Bubbles on UNB-IMT

In future GPS data from Kolhapur and other available close stations would be used to compute the TEC using UNB-IMT during quiet and disturbed periods.
