:                               (name change)
:

```

Dear ISWI Participant:

Last year, I sent out many issues related to RBSP (Radiation Belt Space Probes). Those RBSP issues are as follows:

Vol No. Contents

- ```

4 16 CSSTEAP Newsletter; SERC School in India; a paper on the
. heliosheath; website for RBSP conference
4 58 RBSP 2012 – Part 1: Photo collage and the Final Program for
. this conference
4 75 RBSP 2012 – Part 2: 200+ photos of this conference taken by
. one participant (G. Maeda)
4 77 RBSP 2012 – Part 3: Talk by Dr. D. Sibeck: "Radiation Belt
. Storm Probes (RBSP): Partnership with
. Other Missions."
4 78 RBSP 2012 – Part 4: White Paper by Dr. D. Sibeck: "Opportunities
. for Cooperation: THEMIS and RBSP"
4 82 RBSP 2012 – Part 5: Thank You Letter from the organizing
. committee -- and all presentations
4 87 RBSP Mission -- Interface Control Document (ICD) -- Signed
. and approved for release.
4 94 (1) RBSP Mission launch is soon, and (2) SuperSID Software

```

After the successful deployment of both space probes in Earth orbit, NASA officially changed the name of them to "Van Allen Probes". I attach the Wikipedia write-up on this pair of space probes. If you have any comments on these radiation belt probes, please send them my way.

Humbly and dutifully in the service of ISWI,

```

## Van Allen Probes

From Wikipedia, the free encyclopedia

The **Van Allen Probes** (formerly known as the **Radiation Belt Storm Probes**<sup>[1]</sup> (RBSP)) are two [robotic spacecraft](#) being used to study the [Van Allen radiation belts](#) that surround Earth. [NASA](#) is conducting the Van Allen Probes mission as part of the [Living With a Star](#) program.<sup>[2]</sup> Understanding the radiation belt environment and its variability has important practical applications in the areas of spacecraft operations, spacecraft system design, mission planning and astronaut safety.<sup>[3]</sup> The probes were launched on August 30, 2012.

## Overview

[edit]

NASA's [Goddard Space Flight Center](#) manages the overall [Living With a Star](#) program of which RBSP is a project, along with [Solar Dynamics Observatory](#) (SDO). The [Applied Physics Laboratory](#) is responsible for the overall

implementation and instrument management for RBSP. The primary mission is scheduled to last 2 years, with expendables expected to last for 4 years. The spacecraft will also work in close collaboration with the [Balloon Array for RBSP Relativistic Electron Losses](#) (BARREL), which can measure particles that break out of the belts and make it all the way to Earth's atmosphere.<sup>[4][5]</sup>

The Radiation Belt Storm Probes mission is part of NASA's [Living With a Star](#) program, which is managed by [Goddard Space Flight Center](#) in Greenbelt. The Johns Hopkins University [Applied Physics Laboratory](#) (APL) manages the mission and is building and will operate the Van Allen Probes for NASA.

## Milestones

[edit]

- Mission concept review completed, January 30–31, 2007<sup>[6]</sup>
- Preliminary design review, October, 2008
- Confirmation review, January, 2009
- Probes transported from [Applied Physics Laboratory](#) in Laurel, Maryland to [Cape Canaveral Air Force Station](#) in Florida, April 30, 2012
- Probes launched from Space Launch Complex-41 at [Cape Canaveral Air Force Station](#) in Florida on Aug. 30, 2012. Liftoff occurred at 4:05 a.m. EDT.<sup>[7]</sup>

## Launch vehicle

[edit]

### Van Allen Probes

| <b>Periapsis</b>         | ~700 kilometers                                             |
| <b>Orbital period</b>    | ~9 hours                                                    |

On March 16, 2009 United Launch Alliance (ULA) announced that NASA had awarded ULA a contract to launch RSBP using an [Atlas V 401](#) rocket.<sup>[8]</sup> NASA delayed the launch as it counted down to the four-minute mark early morning on August 23. After bad weather prevented a launch on August 24, and a further precautionary delay to protect the rocket and satellites from [Hurricane Isaac](#), liftoff occurred on August 30, 2012 at 4:05 AM EDT.<sup>[9]</sup>

## Science

[[edit](#)]

The [Van Allen radiation belts](#) swell and shrink over time as part of a much larger space weather system driven by energy and material that erupt off the Sun's surface and fill the entire [Solar System](#). Space weather is the source of [aurora](#) that shimmer in the night sky, but it also can disrupt satellites, cause power grid failures and disrupt [GPS](#) communications. The Van Allen Probes will help scientists to understand this region and to better design [spacecraft](#) that can survive the rigors of [outer space](#).<sup>[2]</sup> The mission is to gain

scientific understanding of how populations of relativistic electrons and ions in space form or change in response to changes in [solar activity](#) and the [solar wind](#).<sup>[2]</sup>

The mission's general scientific objectives are to:<sup>[2]</sup>

- Discover which processes - singly or in combination - accelerate and transport the particles in the radiation belt, and under what conditions.
- Understand and quantify the loss of electrons from the radiation belts.
- Determine the balance between the processes that cause electron acceleration and those that cause losses.
- Understand how the radiation belts change in the context of [geomagnetic storms](#).

## Spacecraft

[[edit](#)]

The Van Allen Probes consists of two spin-stabilized spacecraft to be launched with a single Atlas V rocket. The two probes must operate in the harsh conditions they are studying; while other satellites have the luxury of turning off or protecting themselves in the middle of intense space weather, The Van Allen Probes must continue to collect data. The probes have, therefore, been built to withstand the constant bombardment of particles and radiation they will experience in this intense area of space.<sup>[2]</sup>

## Instruments

[[edit](#)]

Because it is vital that the two craft make identical measurements to observe changes in the radiation belts through both space and time, each probe will carry the following:

1. Energetic Particle, Composition, and Thermal Plasma (ECT) Instrument Suite <sup>[1]</sup> [↗](#); The Principal Investigator is Harlan Spence <sup>[2]</sup> [↗](#) from [University of New Hampshire](#). Key partners in this investigation are [LANL](#), [Southwest Research Institute](#), [Aerospace Corporation](#) and [LASP](#)
2. Electric and Magnetic Field Instrument Suite and Integrated Science (EMFISIS); The Principal Investigator is Craig Kletzing from the [University of Iowa](#).
3. Electric Field and Waves Instrument (EFW); The Principal Investigator is John Wygant from the [University of Minnesota](#). Key partners in this investigation include the University of California at Berkeley and the University of Colorado at Boulder.
4. Radiation Belt Storm Probes Ion Composition Experiment (RBSPICE); The Principal Investigator is Lou Lanzerotti <sup>[3]</sup> [↗](#) from the New Jersey Institute of Technology. Key partners include the [Applied Physics Laboratory](#) and Fundamental Technologies, LLC <sup>[4]</sup> [↗](#).
5. Relativistic Particle Spectrometer (RPS) from the [National Reconnaissance Office](#)
